# Self-Spreading Biotechnology and International Law

Prevention, Responsibility, and Liability in a Transboundary Context

Open Access funding provided by Max Planck Society.

Erstgutachter:	Prof. Dr. Silja Vöneky
Zweitgutachter:	Prof. Dr. Jens-Peter Schneider
Dekan:	Prof. Dr. Katharina von Koppenfels-Spies
Datum der mündlichen Prüfung:	9. November 2021 in Freiburg im Breisgau

**The Deutsche Nationalbibliothek** lists this publication in the Deutsche Nationalbibliografie; detailed bibliographic data are available on the Internet at http://dnb.d-nb.de

a.t.: Freiburg i.Br., Universität, Diss., 2021

ISBN 978-3-8487-7377-0 (Print) 978-3-7489-1352-8 (ePDF)

#### **British Library Cataloguing-in-Publication Data**

A catalogue record for this book is available from the British Library.

ISBN	978-3-8487-7377-0	(Print)	
	978-3-7489-1352-8	(ePDF)

#### Acknowledgements

The present volume is based on my doctoral thesis, which was accepted by the Faculty of Law of the Albert Ludwig University of Freiburg in the winter semester of 2021/22. Case law, sources, and literature were updated for publication in May 2022.

This endeavour would not have been possible without those helping me pursue it until its conclusion. First and foremost, I wish to express my gratitude and appreciation to my supervisor, Professor Silja Vöneky, for her inspiring guidance, constructive feedback as well as her unwavering encouragement and support. I also thank Professor Jens-Peter Schneider, who quickly reviewed my thesis as a second reader.

My research was generously supported by the *Deutsche Bundesstiftung Umwelt* (German Federal Environmental Foundation). Its doctoral scholarship not only gifted me the time and freedom to complete my thesis but also offered stimulating opportunities for interdisciplinary exchange. I would like to extend my sincere thanks to all staff, particularly Sabine Dannhauer, Verena Exner, and Dr. Hans-Christian Schaefer, for their trust in my work and their support.

I wish to thank Professor Armin von Bogdandy and Professor Anne Peters of the Max Planck Institute for Comparative Public Law and International Law in Heidelberg for accepting my volume into the Institute's book series, the *Beiträge zum ausländischen öffentlichen Recht und Völkerrecht*. The Open Access publication of this volume was made possible by the *Nomos* publishing house and a grant by the *Konsortium Baden-Württemberg*, for which I am also much obliged.

For reading draft chapters and providing feedback and corrections, I am grateful to Friedrich Arndt, Chris Patricia Hänsel, Jamie Haughey, Dr. Lisa Schneider, and Miriam Schuler. Special thanks are due to Dr. R. Guy Reeves, who provided invaluable expert advice on scientific questions.

Last, I could not have undertaken this journey without my family, especially my parents, to whom I am deeply indebted for their endless affection, support, and patience.

Berlin, June 2022

# Overview of Chapters

Table of Ab	Table of Abbreviations	
Introduction	Introduction	
Part One:	Self-Spreading Biotechnology Challenges International Law	45
Chapter 1:	The Emergence of Self-Spreading Biotechnology	47
Chapter 2:	Concepts and Terms Relevant to Transboundary Harm Caused by Biotechnology	107
Part Two:	Prevention of Transboundary Harm	129
Chapter 3:	The Regulation of Biotechnology in International Law	131
Chapter 4:	Prevention of Transboundary Harm from Biotechnology Under Customary International Law	247
Chapter 5:	The International Governance of Engineered Gene Drives	317
Part Three:	Operator Liability	365
Chapter 6:	The Nagoya – Kuala Lumpur Supplementary Protocol on Redress and Liability	367
Chapter 7:	A Private Liability Scheme: The 'Biodiversity Compact'	461

## Overview of Chapters

Chapter 8:	A Customary Obligation to Ensure Prompt and Adequate Compensation for Transboundary Damage?	477
Part Four:	Responsibility and Liability of States	493
Chapter 9:	State Responsibility for Transboundary Harm Caused by Biotechnology	495
Chapter 10:	Strict State Liability for Transboundary Harm?	595
Chapter 11:	Compensation for Environmental Damage in International Law	617
Concluding	Remarks	665
Summary of	Results	671
Zusammenf	assung in deutscher Sprache	689
Table of Cas	es	713
Table of Tre	aties and Instruments	721

Chapter 2: Concepts and Terms Relevant to Transboundary Ha	
Caused by Biotechnology	107
A. 'Genetically Modified' and 'Living Modified' Organisms	108
B. Types of Damage Potentially Caused by LMOs	109
C. The Distinction Between 'Responsibility' and 'Liability'	112
D. The 'Polluter-Pays' Principle: State or Operator Liability?	114
E. Standards of Liability: Fault-Based, Objective, Strict, and Absolute Liability	116
F. Procedural Issues in Enforcing Civil Liability in a Transbound Context	lary 119
G. Civil Liability and 'Administrative Liability' for Damage to th Environment	ie 123
H. Summary and Outlook	126
Part Two: Prevention of Transboundary Harm	129
Chapter 3: The Regulation of Biotechnology in International La	aw 131
A. The Cartagena Protocol on Biosafety	132
I. Scope	133
1. Subject Matter: Living Modified Organisms Obtaine	
Through Modern Biotechnology	134
a) Living Organism	135
b) Genetic Material	136
<ul><li>c) 'Novel Combination' of Genetic Material</li><li>d) Obtained Through the Use of Modern</li></ul>	138
Biotechnology	140
aa) 'Application of in vitro nucleic acid	
techniques'	140
bb) ' that overcome natural physiological	
reproductive or recombination barriers'	143
cc) ' and that are not techniques used in	
traditional breeding and selection'	145
e) Coverage of Certain New and Emerging Technic	jues 147
aa) Genome Editing	147
bb) Engineered Gene Drives	148
cc) Genetically Modified Viruses	150

			dd) Techniques That Harness Natural Mechanisms	
			of Self-Propagation (Wolbachia)	150
	2.	Re	estriction to Hazardous LMOs?	151
	3.	Ac	tivities Covered by the Protocol	153
			emption for Transboundary Movement of LMOs	
			hich Are Pharmaceuticals (Article 5)	155
	5.		onclusions	157
II.	Su	bsta	antive Provisions	158
	1.	Ac	lvance Informed Agreement Procedure for	
			ansboundary Movements of LMOs	159
			Scope of the AIA Provisions	160
			Procedure of Obtaining an Advance Informed	
			Agreement From the Party of Import	161
		c)	Risk Assessment	161
		d)	Role of the Precautionary Principle in Decision-	
			Making (Article 10(6))	163
		e)	Role of Socio-Economic Considerations in Decision-	
			Making (Article 26)	164
		f)	Rules for LMOs Intended for Direct Use as Food or	
			Feed, or for Processing (Article 11)	167
		g)	Exemption of Contained Use and LMO-FFP: The	
		-	'Intended Use' Problem	168
			aa) Genuine and Disguised Changes to the	
			Intended Use	169
			bb) Responsibilities of Exporting Parties	171
			cc) Responsibilities of Importing Parties	172
		h)	Conclusions	173
	2.	Ri	sk Management and Preparedness	174
		a)	Risk Management (Article 16)	174
			aa) Obligation to Establish Appropriate Risk	
			Management Measures (para. 1)	174
			bb) Imposition of Preventive Measures Based on	
			Risk Assessment (para. 2)	176
			cc) Prevention of Unintentional Transboundary	
			Movements (para. 3)	177
			dd) Appropriate Observation Period for Any LMO	
			(para. 4)	181
			ee) Obligation to Cooperate (para. 5)	182
		b)	Notification in Case of Unintentional	
			Transboundary Movements (Article 17)	182

		c) Illegal Transboundary Movements (Article 25)	184
		aa) Prevention of Illegal Transboundary	
		Movements (para. 1)	184
		bb) Obligation to Dispose of the LMO in Case of an	
		Illegal Transboundary Movement (para. 2)	186
		d) Handling, Transport, Packaging, and Identification	
		(Article 18(1))	188
		e) Conclusions	189
		3. Information-Sharing Through the Biosafety Clearing-	
		House (Article 20)	190
		4. Application in Relation to Non-Parties (Article 24)	192
		5. Upward Derogation (Articles 2(4) and 14)	194
		6. Liability and Redress (Article 27)	195

Conclusions 388 III. Damage Resulting from LMOs 'Which Find Their Origin in a Transboundary Movement' (Article 3(1)) 389 1. Damage Resulting From Authorized Uses Following Intentional Transboundary Movement (Article 3(2)) 389 2. Damage Resulting From Unintentional Movements (Article 3(3))391 3. Damage Resulting From Illegal Transboundary Movements (Article 3(3)) 392 4. Damage Resulting From Transboundary Movements From Non-Parties (Article 3(7)) 392 5. Damage Resulting From LMOs in Transit 393 6. Damaged Caused by Domestic Activities With LMOs 393 7. Conclusions 394 IV. Temporal Scope (Article 3(4)) 394 V. Spatial Scope (Article 3(5)) 395

VI. Conclusions

397

C.	Admi	inistrative Liability: Response Measures to Redress Damage	
	to Bio	ological Diversity	397
	I.	Meaning and Scope of 'Response Measures'	399
		Identification of the Liable Operator	401
	III.	Establishment of a Causal Link and Standard of Proof	
		(Article 4)	406
	IV.	Implementation of Response Measures (Article 5)	409
		1. Requirement of the Operator to Take Response	
		Measures (para. 1)	409
		2. Responsibilities of the Competent Authority (para. 2)	411
		3. Measures When There Is a Threat of Damage (para. 3)	412
		4. Response Measures Taken Instead of the Responsible	
		Operator (para. 4)	413
		5. Recovery of Expenses by the Competent Authority	
		(para. 5)	414
		6. Reasoning and Legal Review of Decisions (para. 6)	416
	V.	Transposition into Domestic Law	417
		1. Provision of 'Rules and Procedures That Address	
		Damage' (Article 12(1))	417
		2. Response Measures Already Addressed by Domestic	44.0
		Civil Liability Law (Article 5(7))	419
		3. Implementation of Response Measures 'in Accordance $\frac{1}{2}$	12.1
	171	With Domestic Law' (Article 5(8))	421
		Conclusions	421
D.	Civil	Liability for Material and Personal Injury	423
	I.	Scope: Material or Personal Damage Associated with	
		Biodiversity Damage	423
		1. Material or Personal Damage	423
		2. Damage 'Associated' With Biodiversity Damage	425
	II.	Provision of Adequate Rules and Procedures on Civil	
		Liability (Article 12(2))	426
	III.	List of Elements to be Addressed When Developing Civil	
		Liability Law (Article 12(3))	427
		The Meaning of 'Adequate' Rules and Procedures	428
		Conclusions	429
	VI.	Excursus: Draft Guidelines on Civil Liability and Redress	430
E.	Other	r Provisions	433
	I.	Exemptions From Liability, Time and Financial Limits,	
		and Right of Recourse (Articles 6 to 9)	433

	II. Financial Security (Article 10)	435
	1. Right of Parties to Provide for Financial Security	
	(para. 1)	436
	2. Consistency of Financial Security Provisions With	
	Existing International Law (para. 2)	438
	3. Study on Financial Security Mechanisms (para. 3)	439
	4. Conclusions	440
	III. Relationship to State Responsibility (Article 11)	441
	IV. Review of Effectiveness (Article 13)	441
	V. Relationship to Rights and Obligations Under	
	International Law (Article 16)	442
	VI. Governance- and Process-Related Provisions	1.12
	(Articles 14 to 21)	443
F.	Issues Not Addressed by the Supplementary Protocol	444
	I. Transboundary Harm	444
	II. Designation of a Competent Authority	445
	III. Right of Affected Individuals to Request Action	446
	IV. International Coordination of Response Measures	447
	V. Jurisdiction, Applicable Law, and Mutual Recognition and	
	Enforcement of Judgments	448

#### Introduction

"We have thus far been concerned with ultra-hazardous activities arising from the skills and achievements of the physicists, chemists and engineers. The biologists are now entering the picture with experiments which, we are responsibly told, can fundamentally reshape the constituent elements of life, memory and learning. [...] There may well be cases in which the current experiments of molecular biologists involve dangers which pose acutely the problem of liability for the objective risks involved in ultra-hazardous activities."

- C. Wilfried Jenks<sup>1</sup>

It appears that *Jenks* was far ahead of this time when, in his 1966 lecture at the *Hague Academy of International Law*, he mentioned molecular biology as a potential field of application for international law on liability for ultra-hazardous activities. That same year, the genetic code had been 'cracked' when *Marshall Nirenberg* and others had fully elucidated the chemical structure of *deoxyribonucleic acid* or DNA. It took seven more years for the first transgenic organism to be created, and until 1983 for the first genetically engineered crop to be developed.

Nevertheless, legal scholars had long taken up Jenks' initiative and begun contemplating the role of international law in regulating the potential transboundary effects of molecular biotechnology. Already in 1980, *Cripps* assumed that the problem identified by Jenks was now 'far more acute'.<sup>2</sup> At the same time, she observed that 'there is room for doubt regarding the application of recognised general principles of State responsibility to the release of genetically engineered viruses and organisms which traverse national boundaries'.<sup>3</sup>

The global COVID-19 pandemic has made the need to address potential transboundary effects of biotechnology self-evident.<sup>4</sup> Nevertheless, al-

<sup>1</sup> Liability for Ultra-Hazardous Activities in International Law, 117 (1966) RdC 99, 169.

though a laboratory escape has been discussed as a potential origin of the SARS-CoV-2 coronavirus,<sup>5</sup> there is currently no evidence that the virus emerged from a deliberate genetic manipulation.<sup>6</sup> Hence, despite the persistent controversy over the risks of genetic engineering, there appears to be no case in which a *genetically modified organism* (GMO) has ever caused significant transboundary harm; there has never been a GMO 'equivalent of the Torrey Canyon disaster or Chernobyl'.<sup>7</sup> Genetically modified crops, which are the most widespread instance of biotechnology released into the environment, are not known to have a direct cause-and-effect relationship with present environmental problems; common issues are rather caused by the agricultural practices associated with – but not exclusive to – the use of such crops, such as monoculture farming and intensive herbicide spraying.<sup>8</sup>

However, recent advances in molecular biology will likely produce entirely new classes of GMOs that may well have transboundary effects in the foreseeable future. These advances are led by the development of *genome editing* techniques, which can modify genetic information on the level of individual *base pairs* (or 'letters') in the DNA of virtually any organism. Compared to conventional genetic engineering techniques applied since the 1970s, genome editing is much more precise, versatile, and cheaper to apply. Moreover, it potentially allows the introduction of genetic modifications without inserting DNA derived from other species (so-called *transgenes*). This challenges existing regulatory frameworks that mostly attach to the presence of transgenic DNA in the resulting organism.

<sup>8</sup> See NASEM, Genetically Engineered Crops (2016), 97–170; see chapter 1, section B.V.2.

The advent of genome editing also enables new approaches in the development of *self-spreading biotechnology*, by which I refer to genetically modified organisms and viruses specifically engineered to spread rapidly through natural populations. This includes *gene drives*, which are 'selfish' genetic elements that use various molecular mechanisms to bias inheritance in their favour, thus overriding the natural 50 % probability of inheritance commonly found in sexually reproducing organisms.<sup>9</sup> Engineered gene drives can be used to disseminate genetic modifications through natural populations of a particular species, either to change certain characteristics of that species or to reduce its abundance, potentially to the point of extinction. The currently most advanced research in the field of engineered gene drives aims to suppress populations of mosquito species that transmit malaria to humans.<sup>10</sup>

Since gene drives create a *vertical spread* by increasing the rate of their transmission to subsequent generations, it usually takes several generations for the drive construct to become prevalent in a population. In contrast, *horizontal* self-spreading techniques aim for a spread within the same generation of organisms. This can be achieved by genetically engineering pathogens or symbionts so that they perform certain tasks in the target organism once they have reached it. For instance, genetically modified viruses have been used to protect crops against infectious diseases.<sup>11</sup> Moreover, current research aims at developing viruses that perform genome editing directly in their target organism, which potentially allows to genetically modify entire populations or even species of organisms within a single generation.<sup>12</sup> These so-called *horizontal environmental genetic alteration agents* (HEGAAs) also raise concerns about their potential for misuse as biological weapons.<sup>13</sup>

Engineered gene drives and HEGAAs share a feature that distinguishes them fundamentally from conventional approaches to genetic engineering: genetic modification is no longer performed under controlled conditions in a laboratory but takes place directly in the environment. These approaches thus imply a 'shift from the release of a finished and tested

product to the release of an adjustable tool for genetic modification that is released into ecosystems'.<sup>14</sup> Most existing risk assessment and management frameworks are not yet equipped to address the particular risks that arise from such uncontrolled modification processes.

It appears to be undisputed that the emergence of self-spreading biotechnology presents significant challenges to international law. These challenges are aptly exemplified by the case of live viruses engineered into 'transmissible vaccines'. Around two decades ago, Spanish researchers developed such a transmissible vaccine to protect wild rabbits, which are an endangered species in their native habitat, the Iberian Peninsula.<sup>15</sup> This vaccine, however, protects rabbits against the very same natural viruses used for biological control in Australia, where the European rabbit is an invasive species that has caused devastating effects on local ecosystems.<sup>16</sup> Considering previous examples of unintentional or illegal transboundary movements of biocontrol agents,<sup>17</sup> it would seem just a matter of time until such a vaccine occurred in Australia and undermined biocontrol efforts there.

A similar example is the proposed use of an engineered gene drive to suppress *Palmer amaranth*, which has developed resistance to glyphosate and has become a major agricultural weed in the Southern United States.<sup>18</sup> However, Palmer amaranth can interbreed with related *Amaranthus* species cultivated as food crops in nearby Mexico and elsewhere.<sup>19</sup> An unintended spread of a suppression drive in Palmer amaranth could, therefore, severely impact the production of Amaranth crops.<sup>20</sup> There are numerous similar examples where the use of self-spreading biotechnology by one state may

Introduction

be incompatible with the priorities and interests of other states.<sup>21</sup> Genetic techniques aimed at suppressing or eradicating entire species may even be incompatible with international law altogether.<sup>22</sup>

While it is commonplace that uncontrolled transboundary dispersals and adverse side-effects of self-spreading biotechnology shall be prevented, it is yet uncertain under which conditions accountability can be established when such effects occur nevertheless. Only recently, a paper in the journal *Science* asked: 'Who is responsible, or liable, if self-spreading viruses don't behave as expected or cross national borders?'<sup>23</sup> For this reason, the present study addresses the challenges to international law posed by self-spreading biotechnology not only from the perspective of *prevention* but also gives prominence to the issues of *responsibility* and *liability*.

In the context of hazardous activities such as those at stake, the concept of liability serves two purposes. The most natural and important function of liability is *reparation*, which means that the injury suffered by the victim of a harmful event shall be remedied.<sup>24</sup> The reparative dimension of liability gives effect to the 'polluter-pays principle', seeking to ensure that the injurious consequences of harm should not 'lie where they fall' but be repaired by the party which has caused the damage.<sup>25</sup> In other words, the purpose of reparation is 'to shift the loss unreasonably suffered by the victim to the tortfeasor'.<sup>26</sup> Moreover, reparation also may have a *corrective* function in that it provides a method of enforcing the law *ex post facto*.<sup>27</sup> This is particularly relevant in the context of international law, which provides only limited means to 'punish' states for serious breaches of their obligations.<sup>28</sup>

Besides its *reparative* function, liability also has a *preventive* effect. It is assumed that the risk of being exposed to liability deters noxious behaviour and provides an incentive to act diligently and prevent damage.<sup>29</sup> In other words, it may be more economical for a party to prevent damage from the outset rather than having to compensate for it later.<sup>30</sup> In the context of molecular biotechnology, it has even been assumed that the prevention of damage was the 'primary goal of liability'.<sup>31</sup>

The prevention of, and responsibility and liability for, transboundary harm under international law is already a thoroughly studied field. The United Nations' *International Law Commission* has spent decades of work on this issue,<sup>32</sup> and the body of scholarly literature in the field is overwhelming.<sup>33</sup> However, the specific problems evoked by self-spreading biotechnology demand a fresh look at the topic. Moreover, the *Nagoya* – *Kuala Lumpur Supplementary Protocol on Liability and Redress*, which provides dedicated rules and procedures for transboundary damage caused by genetically engineered organisms, entered into force in 2018.<sup>34</sup> This is notable far beyond the present context, as the Supplementary Protocol is the first global treaty on liability for transboundary harm outside the areas

of oil pollution, nuclear damage, and space law that has ever attracted sufficient ratifications to enter into force.<sup>35</sup> The Supplementary Protocol also signifies the result of a 'paradigm evolution' by providing for an 'administrative approach' to liability instead of pursuing the conventional civil liability approach.<sup>36</sup> Nevertheless, it has only received comparatively little scholarly attention since it was adopted in 2010.<sup>37</sup>

While the Supplementary Protocol provides for the liability of 'operators', it leaves the role of states largely unaddressed. In fact, the responsibility and liability of states in the context of transboundary harm caused by biotechnology are still unsettled. The ongoing negotiations about the international regulation of engineered gene drives aptly demonstrate the dire need for conceptual clarity on the obligations, responsibilities, and – ultimately – the liability of states for transboundary harm caused by such techniques.<sup>38</sup> In 2020, two leading Australian and German regulators noted that whether the international law of state responsibility for wrongful acts 'may apply for negative effects caused by [Gene Drive] releases is [...] not completely solved yet'.<sup>39</sup> The present study seeks to capture the current state of development of international law by taking stock of the existing rules pertaining to transboundary effects of biotechnology and by carving out the remaining gaps and grey areas.

*Part One* sets the scene by reviewing the recent developments in biotechnology and the resulting challenges to international law. *Chapter 1* reviews the aforementioned advances in molecular biology, particularly the emergence of self-spreading biotechnology. It also identifies the limitations and risks of these techniques which may potentially give rise to transboundary harm. Subsequently, *chapter 2* briefly introduces key terms and concepts relevant to responsibility and liability for transboundary harm under international law.

Part Two analyses the rules of international law relating to the prevention of harm from conventional and self-spreading biotechnology. The principal instrument in this field is the Cartagena Protocol on Biosafety,

<sup>35</sup> On this problem generally, see *Anne Daniel*, Civil Liability Regimes as a Complement to Multilateral Environmental Agreements, 12 (2003) RECIEL 225.

<sup>39</sup> *Heidi J. Mitchell/Detlef Bartsch*, Regulation of GM Organisms for Invasive Species Control, 7 (2020) Front. Bioeng. & Biotechnol. 927, 4.

which applies to 'living modified organisms' (LMOs).<sup>40</sup> However, it is currently controversial whether the Protocol's scope extends to genomeedited organisms that do not contain transgenic DNA. Moreover, some authors have contended that the Protocol may not apply to organisms containing engineered gene drives. Therefore, *chapter 3* clarifies the Protocol's scope before assessing its substantive provisions, which focus on the *transboundary movement* of LMOs. The chapter also addresses a range of other relevant instruments, including the *Convention on Biological Diversity* and the *Biological Weapons Convention*.

In addition to international treaties, the general rules of customary international law on the prevention of transboundary harm are highly relevant. On the one hand, this is because several states that are key actors in the field have not ratified the Cartagena Protocol. On the other hand, the general obligation of prevention is only insufficiently incorporated in the aforementioned treaties, thus giving even higher relevance to the general rules of customary international law. *Chapter 4* assesses the pertinent rules of custom relating to the prevention of transboundary harm, including the precautionary principle. The chapter also explores how breaches of these rules can be established.

As previously mentioned, there is currently a vivid debate among states on the general lawfulness of, but also the conditions for, environmental releases of organisms containing engineered gene drives. *Chapter 5* captures the current state of this debate and analyses the consequences of the first set of conditions agreed upon by states in 2018. It also identifies issues that have not yet been adequately addressed, such as the lack of binding standards on laboratory biosafety – an issue that may have become literally virulent as coronaviruses were routinely studied in medium-safety BSL-2 laboratories around the world before the outbreak of COVID-19.<sup>41</sup>

Part Three focuses on the liability of operators, which means those state and non-state actors involved in developing, producing and releasing biotechnological products. Chapter 6 undertakes a thorough analysis of the aforementioned Nagoya – Kuala Lumpur Supplementary Protocol. The Supplementary Protocol addresses damage to biological diversity resulting

<sup>40</sup> The Cartagena Protocol as well as the Supplementary Protocol refer to 'living modified organisms' (LMOs) instead of the more common term 'genetically modified organisms' (GMOs). The present study refers to LMOs unless where addressing other national or international instruments that apply to GMOs. See chapter 3, section A.I.1.

<sup>41</sup> Andersen et al. (n. 6).

from transboundary movements of LMOs and provides for the imposition of operator liability under the domestic legal systems of its state parties. However, it only insufficiently regulates several issues that are crucial in those transboundary situations to which the Protocol applies. In any event, the largest weakness of the Supplementary Protocol lies in its limited membership – as of May 2022, it has only 49 parties, missing many states that are key players in the field of biotechnology.

An alternative approach to operator liability is offered by the *Biodiversity Compact*, a private scheme by which a group of major biotechnology corporations have voluntarily assumed liability for biodiversity damage caused by any of their LMOs. *Chapter 7* examines this instrument and discusses whether it can fill the gaps left by the Supplementary Protocol. Furthermore, it has been suggested that there is an emerging rule of international law that states must ensure 'prompt and adequate compensation' of foreign victims in the event of significant transboundary harm. *Chapter 8* assesses whether this obligation, which aims at the provision of transnational operator liability, is already part of current international customary law.

*Part Four* addresses the responsibility and liability of states. *Chapter 9* analyses the law of state responsibility for breaches of international law. It thus builds upon the preceding chapters, which have focused on 'primary' obligations of states to prevent transboundary harm and to provide for operator liability when such harm occurs. The chapter analyses the conditions under which states are internationally responsible as well as the consequences and implementation of such responsibility.

Due to the legal nature of the obligation to prevent transboundary harm, the mere occurrence of such harm does not always indicate a breach of international law. Thus, there may well be cases in which transboundary harm occurs but neither the operator nor the state is required to compensate under the aforementioned regimes. Against this background, there are convincing policy arguments in favour of strict state liability, which refers to an obligation of states to compensate for transboundary damage regardless of whether they have breached international law. *Chapter 10* undertakes an analysis of international practice to determine whether strict state liability can be established as a rule of contemporary customary international law.

Finally, a controversial topic cutting across all of the aforementioned instruments and regimes is to which extent international law provides for compensation for environmental damage. The underlying question is whether the intrinsic value of the environment *per se* can be quantified

#### Introduction

in monetary terms, which is widely seen as a precondition for compensability. But determining the 'nature and quantum' of compensation for environmental damage raises complex problems, as shown by the first-ever judgment on this issue by the *International Court of Justice* in 2018.<sup>42</sup> *Chapter 11* analyses this judgment as well as other international practice and carves out generally accepted principles.

In sum, the present study seeks to provide conceptual clarity on the complex interaction between prevention, responsibility, and liability for transboundary harm under international law. It demonstrates how states are required to prevent transboundary harm from being caused by applications of biotechnology. It establishes that states must ensure that operators who have caused such harm can be held liable under their domestic legal system. States themselves are only responsible for transboundary harm if they have failed to take diligent action towards preventing such harm or if they fail to ensure that foreign victims can obtain prompt and adequate compensation from the responsible operators under their domestic legal system. Thus, although states will rarely be liable themselves, they must still ensure that such harm does not remain unredressed. Clarifying the interplay between primary and secondary obligations in international law as it stands today will help to gradually improve these obligations and to fill the remaining gaps.
